Know Your Network's Vulnerabilities

117, 339 Cyber Crime incidents are detected per day.*

Is My Company at Risk?

Many companies depend on technology to conduct their business, ranging from storing information to performing daily business operations. As more companies adopt a "Bring Your Own Device" policy and utilize cloud services, more vulnerable areas are created. Forrester Research noted that 53% of attacks are due to software vulnerabilities. Business interruption and loss of reputation could devastate a company of any size. For many small to midsize companies, the idea that their computer networks are a target for cyber criminals is not considered, but they have the most to lose. It is advisable to utilize a knowledgeable and reputable service to protect your business. Our certified professionals can help you keep your company running smoothly with a network scan.

SHIELD
NETWORK SCAN

What is a Network Scan?

The Shield Network Scan reviews your networks to find vulnerable areas that could allow hackers to access or manipulate your data or network. The scan assesses your systems, networks, and applications for weakness without entering your system. It also looks for common oversights such as missing a security patch or using default or common passwords on user and system accounts.

The Process is Easy and Secure

1. You provide Avalon with your network information (just external IP addresses).

2. Avalon performs a sweep of your company's systems in order to identify vulnerabilites and areas where security could be improved.

3. An Executive Summary and Detailed Report will be provided. The items will categorized as low, medium, and high in order to help you prioritize next steps.

Rest assured that we will not access your confidental information or penetrate your systems. The Shield Network Scan identifies where weaknesses lay and areas that can be open to attacks. This allows you to proactively safeguard your digital assets. Scans can be done bi-annually to continually check your systems for any new threats.
